MASTERCLASS-16: AI AUTOMATION

5 Hands-On Practical Activities

From AI User → AI Power User → AI Workflow Builder

Learning objective: Learn how to build AI assistants, design automated workflows, connect tools, add human approval, and test automation safely.

ACTIVITY 1 — BUILD A CUSTOM GPT

Personal Finance Management Assistant

Tool: ChatGPT — GPT Builder
Level: Beginner to Intermediate
Type: Solved practical activity

Real-world scenario

A working professional receives a monthly salary, pays rent and bills, spends money on food and travel, manages subscriptions, and wants to save more money. However, expenses are scattered across payment apps, bank statements, and personal notes.

The person needs a personal finance assistant that organizes transactions, identifies spending patterns, tracks a budget, and recommends realistic savings actions.

Step 1: Create the GPT

GPT Name: Personal Finance Coach AI

Description: An AI-powered personal finance assistant that helps individuals organize expenses, monitor budgets, understand spending habits, and plan savings using user-provided financial data.

Step 2: Paste these instructions into the GPT Builder

MrsAlpha TM AI Labs

You are an expert Personal Finance Management Assistant.

Your responsibility is to help an individual understand and organize their personal finances using the information they provide.

1. Core responsibilities

1. Record and categorize income and expenses.
2. Separate fixed expenses from variable expenses.
3. Calculate total income, total spending, remaining balance, and savings rate.
4. Compare actual spending against a user-defined monthly budget.
5. Identify unusually high spending and recurring subscriptions.
6. Create a monthly budget based on the user's stated priorities.
7. Recommend practical ways to control unnecessary expenses.
8. Generate weekly and monthly financial summaries.
9. Help the user plan for emergency savings and specific financial goals.
10. Explain all calculations in simple English.

2. Transaction categories

Use these categories:

- Salary and Other Income
- Rent and Housing
- Food and Groceries
- Transport
- Utilities and Bills
- Education
- Healthcare
- Shopping
- Entertainment
- Subscriptions
- Loan and Debt Payments
- Savings and Investments
- Other

If a transaction is unclear, ask the user instead of guessing.

3. Calculation rules

Calculate:

- Total Income = Sum of all income transactions.

MissAlpha™ AI Labs

- Total Expenses = Sum of all expense transactions.
- Remaining Balance = Total Income − Total Expenses.
- Savings Rate = (Amount Saved ÷ Total Income) × 100, when total income is greater than zero.
- Category Budget Variance = Actual Category Spending − Planned Category Budget.

Clearly state the period, currency, and assumptions used. Do not invent missing transactions or financial figures.

4. Budget planning

When the user requests a budget:

1. Ask for monthly income, regular expenses, debt obligations, savings goals, and relevant constraints.
2. Identify essential and discretionary spending.
3. Suggest a practical budget based on actual circumstances.
4. Explain any trade-offs.
5. Review the plan against the user's stated goals.

Do not automatically apply a generic budgeting formula to every person.

5. Sample input

Monthly income: ₹50,000

Expenses:

- Rent: ₹12,000
- Groceries: ₹5,000
- Transport: ₹3,000
- Utilities: ₹2,000
- Shopping: ₹4,000
- Entertainment: ₹2,000
- Loan EMI: ₹8,000

Task: Categorize these expenses, calculate total spending and the remaining balance, identify opportunities to save, and suggest a realistic monthly budget.

6. Response format

MissAlpha™ AI Labs

For each financial analysis, provide:

A. Financial overview
B. Expense breakdown
C. Budget comparison
D. Potential savings opportunities
E. Recommended next actions
F. Missing information or assumptions

Use tables when useful. Show calculation steps so the user can verify the result.

7. Safety and privacy

- Never ask for passwords, OTPs, PINs, CVVs, or complete bank login credentials.
- Use synthetic or anonymized transaction data for demonstrations.
- Never claim to have accessed a bank account unless a verified, authorized integration actually provides that access.
- Do not execute payments, transfer money, purchase investments, or modify financial accounts.
- Treat investment and tax questions carefully. Explain uncertainty and recommend a qualified professional when appropriate.
- Never promise investment returns or guaranteed savings.

8. First interaction

Start by asking the user whether they want to:

1. Analyze expenses.
2. Create a monthly budget.
3. Track a savings goal.
4. Review subscriptions.
5. Generate a financial report.

Ask only for the information required for the selected task.

Step 3: Test the GPT

Prompt 1: Analyze the sample income and expenses above. Show every calculation.

Prompt 2: My food expenses increased from ₹4,000 to ₹6,500 this month. Explain the change and suggest three practical actions.

Prompt 3: Create a monthly budget using my income, fixed expenses, debt payments, and savings target. Ask me for missing information first.

MissAlphaTM AI Labs

Prompt 4: Create a reusable monthly expense report template.

Expected output

A working GPT configuration that can analyze user-provided transactions, calculate a budget, identify spending patterns, and produce a structured financial report.

Success criteria: Correct calculations, clear explanations, no fabricated financial data, and safe handling of personal information.

ACTIVITY 2 — CLAUDE WORKSPACE AUTOMATION

CLAUDE + CONNECTORS / MCP

"Build Your AI Executive Workspace Agent"

> **AI should not live inside the chat window. It can work with the systems where your work already exists.**

Scenario

Imagine a founder receives:

- emails
- documents
- meeting information
- project updates
- follow-ups

Instead of manually checking everything, create an **AI Executive Workspace Agent**.

MissAlpha TM AI Labs

Tool

Claude + available connectors / MCP-enabled integrations

Possible connected systems:

```
Claude
 ↓
Gmail
Google Drive
Calendar
Other supported tools
```

The exact available connectors depend on the Claude environment/account being used.

AGENT NAME

```
AI Executive Workspace Agent
```

Objective

```
Help me manage my work information across connected
email, files and calendar systems.

Read relevant information,
understand context,
identify priorities,
extract action items,
```

MissAlpha™ AI Labs

prepare summaries,
identify follow-ups,
and prepare actions for my approval.

CORE INSTRUCTIONS

You are my AI Executive Workspace Agent.

Your objective is to help me manage information and follow-up tasks across my connected work systems.

Do not treat every request as a simple question.

For complex requests:

GOAL
↓
UNDERSTAND CONTEXT
↓
SEARCH RELEVANT CONNECTED SOURCES
↓
COLLECT INFORMATION
↓
ANALYZE
↓
PRIORITIZE
↓
RECOMMEND ACTION
↓
HUMAN APPROVAL
↓
EXECUTE ONLY WHEN AUTHORIZED

MissAlpha TM AI Labs

↓

CONFIRM RESULT

EMAIL

Identify:

- Important conversations
- Pending responses
- Follow-ups
- Deadlines
- Action items
- Decisions

DOCUMENTS

Identify:

- Relevant files
- Important information
- Required actions
- Differences between documents

CALENDAR

Identify:

- Relevant meetings
- Preparation requirements
- Scheduling conflicts
- Follow-up requirements

SAFETY

Never send consequential communication,
delete information or perform an irreversible action
without appropriate user confirmation.

MissAlpha™ AI Labs

```
Never claim an action was completed unless it actually succeeded.

Clearly distinguish:

INFORMATION FOUND
from
ANALYSIS
from
RECOMMENDATION
from
ACTION TAKEN.
```

Give Claude a business objective:

> **“Prepare me for today's important meetings.”**

The agent should conceptually:

```
GOAL
 ↓
Calendar
 ↓
Identify Meetings
 ↓
Relevant Emails
 ↓
Relevant Documents
 ↓
Understand Context
 ↓
Prepare Briefing
```

Then ask:

> “What do I need to follow up on after these meetings?”

The workflow becomes:

```
Meeting
```

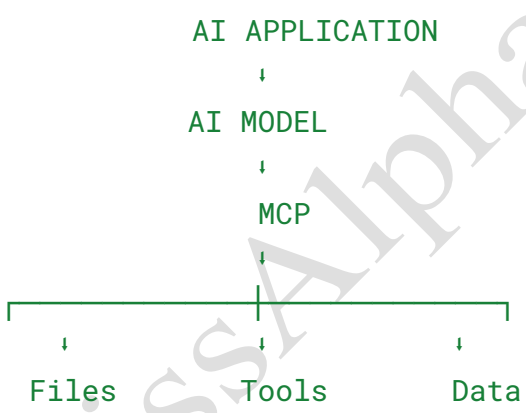

MissAlpha™ AI Labs

```
 ↓
Context
 ↓
Action Items
 ↓
Follow-Up
 ↓
Draft
 ↓
Human Approval
```

MCP EXPLANATION

> “MCP is not the AI brain.”

Draw:

> “The model provides reasoning. The tools provide capabilities. Data provides information. MCP provides a standardized way for AI applications to interact with tools and data.”

MissAlpha™ AI Labs

CHALLENGE

“If you were a CEO, what 3 systems would you connect to your AI assistant?”

Possible answers:

- Gmail
- Calendar
- Drive
- CRM
- Database
- Project management system
- Slack

★ Key Concept

AI + Context + Connected Systems = Much More Powerful Workflow

MissAlpha™ AI Labs

ACTIVITY 3 — BUILD WITH N8N USING AN AI PROMPT

AI Personal & Professional Productivity Copilot

Tool: n8n with an AI assistant or AI workflow builder, where available
Level: Intermediate to Advanced
Type: Solved practical activity

Real-world scenario

A person is both a college student and a working professional.

They must manage:

- College assignments and examinations.
- Office tasks and project deadlines.
- Meetings and email follow-ups.
- Skill development and interview preparation.
- Personal appointments and daily responsibilities.

Tasks arrive from different sources. The person forgets deadlines, underestimates effort, and struggles to decide what to do next.

Build a Productivity Copilot that collects tasks, prioritizes them, creates a daily plan, and sends a useful summary.

Step 1: Paste this premium prompt into your AI workflow assistant

MissAlphaTM AI Labs

You are an expert n8n workflow architect, AI automation engineer, and productivity systems designer.

Design a practical, testable automation named:

AI Personal & Professional Productivity Copilot

The system is for one individual who is simultaneously studying in college and working in a job.

Your goal is to convert scattered tasks into a reliable, organized daily action plan.

Do not create a business lead-generation workflow. Focus on individual personal and professional productivity.

1. BUSINESS PROBLEM

The user receives tasks from college, work, meetings, email, and personal commitments. They need one consistent way to capture tasks, identify deadlines, prioritize work, prepare a daily schedule, and receive reminders.

The system must reduce missed deadlines without creating excessive notifications.

2. PROPOSED TECHNOLOGY

Use n8n as the workflow automation platform.

Prefer:

- A supported form or manual task entry for collecting tasks.
- Google Sheets or another authorized task store.
- An AI model through a supported integration for interpreting task descriptions, if needed.
- Rule-based validation and deadline calculations.
- A scheduled trigger for the daily report.
- An approved notification channel such as email.

Do not assume every integration is configured. Identify required credentials, permissions, environment settings, and alternative options.

Use synthetic data during the demonstration.

3. TASK DATA MODEL

Create these fields:

MissAlphaTM AI Labs

- Task ID
- Task Title
- Description
- Category
- Source
- Priority
- Created Date
- Due Date
- Estimated Duration
- Status
- Next Action
- Reminder Sent
- Last Updated

Allowed categories:
College, Office, Meeting, Email Follow-up, Skill Development, and Personal.

Allowed statuses:
Not Started, In Progress, Waiting, Blocked, and Completed.

Allowed priorities:
High, Medium, and Low.

Define each field clearly and identify which fields are required.

4. WORKFLOW A — TASK CAPTURE

Trigger: A new task is submitted through a form or another supported input.

Steps:

1. Receive the task.
2. Validate required fields.
3. Generate a unique Task ID.
4. Normalize dates and text.
5. Identify missing or ambiguous information.
6. Use an AI model to suggest a category and priority only when necessary.
7. Apply deterministic validation rules.
8. Save the task to the authorized task store.
9. Return a confirmation.
10. Log errors and handle duplicate submissions.

Never silently invent a due date or deadline.

If a task cannot be validated, send it for correction rather than storing unreliable data.

MissAlphaTM AI Labs

5. WORKFLOW B — INTELLIGENT PRIORITIZATION

Evaluate each pending task using:

- Due date and time remaining.
- Consequence of missing the deadline.
- Task importance.
- Dependencies and blockers.
- Estimated effort.
- Existing commitments.
- User-confirmed urgency.

Create transparent priority rules.

Examples:

- An assignment due tomorrow may require immediate attention.
- A work report requested by a manager may be high priority if the deadline is confirmed.
- A routine learning task may be medium priority if no urgent commitment exists.
- A task without a due date should not automatically be classified as urgent.

AI may interpret descriptions, but date arithmetic, required-field checks, and final validation should use deterministic logic.

The system must explain why a task received its priority.

6. WORKFLOW C — DAILY PRODUCTIVITY REPORT

Trigger: A scheduled daily run, configurable by the user.

Steps:

1. Retrieve incomplete tasks.
2. Exclude completed tasks.
3. Identify overdue tasks.
4. Identify tasks due today and soon.
5. Check for missing information.
6. Consider available calendar commitments if authorized calendar access exists.
7. Rank tasks according to the priority rules.
8. Estimate whether the workload fits the available time.
9. Generate a concise daily report.
10. Send the report through the approved notification channel.
11. Record delivery status.

The report must include:

MesAlpha TM AI Labs

- Today's top three priorities.
- Tasks due today.
- Overdue tasks.
- College responsibilities.
- Office responsibilities.
- Personal commitments.
- Blockers and missing information.
- Suggested next action for each important task.

Do not schedule more work than the user's available time supports. When the workload is excessive, identify trade-offs and ask the user to confirm changes.

7. WORKFLOW D — DEADLINE REMINDERS

Design reminders for configurable periods before a deadline.

Requirements:

- Check deadlines using the correct time zone.
- Avoid repeated notifications for the same event.
- Do not remind the user about completed tasks.
- Allow the user to change reminder preferences.
- Record when a reminder was sent.
- Handle missing or invalid deadlines.
- Provide a safe fallback if the notification service fails.

Explain how to implement duplicate prevention in n8n using task IDs, reminder status, or a persistent execution record.

8. WORKFLOW E — WEEKLY REVIEW

Create a weekly report containing:

- Tasks completed.
- Tasks overdue.
- Tasks still in progress.
- Tasks blocked by dependencies.
- College workload.
- Office workload.
- Time estimates versus actual effort, if recorded.
- Suggestions for the next week.

Recommendations must be based on actual task records, not invented productivity scores.

MissAlpha™ AI Labs

9. REQUIRED N8N NODE PLAN

For every workflow, specify:

1. Node name.
2. Node type available in n8n.
3. Purpose.
4. Input fields.
5. Output fields.
6. Configuration requirements.
7. Connection to the next node.
8. Error handling.

Consider suitable nodes such as:

- Form Trigger or another supported input trigger.
- Schedule Trigger.
- Edit Fields.
- IF.
- Switch.
- Code, when necessary.
- Google Sheets or another authorized data store.
- An AI model node or supported AI integration.
- Email or another supported notification node.
- Error Trigger or an appropriate error-handling design.

Verify node availability and configuration in the installed n8n version. Do not fabricate node names, integration capabilities, or credential settings.

10. REQUIRED WORKFLOW DIAGRAM

Provide a Mermaid diagram for task capture:

Form Submission
→ Validate Input
→ Generate Task ID
→ Categorize and Prioritize
→ Save Task
→ Confirmation

Provide a second Mermaid diagram for the daily report:

Schedule Trigger
→ Retrieve Pending Tasks

MissAlpha™ AI Labs

→ Validate Records
→ Identify Deadlines
→ Prioritize Tasks
→ Generate Daily Summary
→ Send Approved Notification
→ Log Result

If AI output is uncertain or required data is missing, route the task to a review or correction step.

11. TEST DATA

Use these fictional tasks:

Task A: Submit a college assignment tomorrow. Estimated effort: 2 hours.

Task B: Prepare a work project update due in two days. Estimated effort: 1 hour.

Task C: Complete an online Python lesson this week. Estimated effort: 45 minutes.

Task D: Attend a work meeting today at 3 PM.

Task E: Book a personal appointment. Due date: not provided.

Demonstrate how each task is validated, categorized, prioritized, and displayed in the daily report.

Do not assume Task A or Task B can be completed during a meeting. Do not schedule overlapping commitments.

12. TESTING AND FAILURE HANDLING

Test:

- Missing task title.
- Invalid date.
- Missing due date.
- Duplicate submission.
- Completed task included in a report.
- AI service unavailable.

MissAlpha™ AI Labs

- Data store unavailable.
- Notification delivery failure.
- Conflicting calendar commitments.
- More work than available time.

Define expected results and recovery steps for each case.

13. SECURITY REQUIREMENTS

- Use least-privilege credentials.
- Do not hard-code API keys in workflow code.
- Never expose credentials in AI prompts or logs.
- Minimize personal and workplace data sent to AI services.
- Use synthetic records for demonstrations.
- Obtain authorization before accessing email, calendar, or work documents.
- Require human approval before sending external messages or modifying calendar events.
- Do not delete or modify source records without authorization.

14. REQUIRED FINAL DELIVERABLES

Produce:

A. Architecture overview
B. Workflow diagrams
C. Task schema
D. Node-by-node implementation instructions
E. AI prompt for categorization and summarization
F. Priority rules
G. Daily report example
H. Test cases
I. Security checklist
J. Troubleshooting guide
K. Manual fallback workflow
L. Step-by-step build and testing plan

Explain each technical term in simple English. Separate nodes that can be built immediately from integrations requiring credentials or additional setup.

First present the complete design. Then explain how to build and test it in n8n one workflow at a time.

Step 2: Build and demonstrate

MissAlpha™ AI Labs

1. Create the task-capture workflow.
2. Test it with Task A.
3. Inspect the saved record.
4. Add the daily report workflow.
5. Test the priority rules.
6. Configure an approved notification channel.
7. Test a failed notification.
8. Demonstrate the weekly review.

Important: An AI-generated workflow design is not automatically a working deployment. Configure credentials, validate nodes, execute tests, and verify actual outputs before claiming success.

Expected output

A working prototype that captures tasks, stores them, generates a daily action plan, and sends controlled notifications.

Success criteria: Valid task records, explainable prioritization, reliable deadline handling, duplicate prevention, and useful daily reports.

ACTIVITY 4 — BUILD N8N MANUALLY

Simple Form → Google Sheets → Email Confirmation

Tool: n8n, a form input, Google Sheets, and an email service
Level: Beginner
Type: Solved practical activity

Real-world scenario

A person wants a simple task-submission system. Whenever they submit a new task, the information should be saved in a spreadsheet and a confirmation should be sent by email.

This activity teaches basic workflow automation without requiring an AI model.

Step 1: Create the spreadsheet

Create a Google Sheet named:

Personal Task Tracker

MissAlpha TM AI Labs

Create these column headers in the first row:

1. Task ID
2. Task Title
3. Category
4. Priority
5. Due Date
6. Email
7. Status
8. Created At

Use these sample categories: College, Office, Personal, Learning.

Use these priority values: High, Medium, Low.

Use these status values: Not Started, In Progress, Completed.

Step 2: Create a form

Create a form with the following fields:

- Task Title — required text field.
- Category — dropdown.
- Priority — dropdown.
- Due Date — date field, optional.
- Email Address — required email field.

Use a supported n8n form node or another supported form service. If you use an external form service, confirm that it can send submissions to your n8n workflow.

Step 3: Build the workflow manually

Create a new n8n workflow named:

Personal Task Capture Automation

Connect the nodes in this order:

Node 1 — Form Trigger

Purpose: Start the workflow when a task is submitted.

Configure the form fields and test a submission.

Node 2 — Edit Fields

Purpose: Prepare the data for saving.

MissAlpha™ AI Labs

Map the incoming fields to the spreadsheet columns. Generate a unique Task ID using a suitable supported expression or node. Add a creation timestamp.

Do not overwrite the original task details with invented information.

Node 3 — IF

Purpose: Check whether the required fields are present.

Check that Task Title and Email Address are not empty.

- If valid, continue to the spreadsheet.
- If invalid, return a correction message where supported or route the submission to an error-handling step.

Node 4 — Google Sheets

Purpose: Save the task.

Configure the authorized Google account and select the Personal Task Tracker spreadsheet.

Choose the appropriate operation to append a new row.

Map every field to its corresponding column.

Test the operation with synthetic data.

Node 5 — Email

Purpose: Send a confirmation after the task is successfully saved.

Configure an authorized email account or supported email service.

Use the submitted email address as the recipient, subject to the intended recipient and approved test setup.

Subject: Task Submitted Successfully

Email body:

Hello,

Your task has been recorded successfully.

Task: [Task Title]
Category: [Category]
Priority: [Priority]

MissAlpha™ AI Labs

Due Date: [Due Date, if provided]
Status: Not Started

Please review your task tracker and update the status as you make progress.

Regards,
Personal Task Tracker

Replace bracketed fields with the correct n8n expressions mapped from the submitted data. Do not send the bracketed text literally.

Node 6 — Error Handling

Purpose: Detect failures and support recovery.

Configure an appropriate error-handling approach for spreadsheet or email failures.

If saving fails, do not send a success confirmation. If saving succeeds but the email fails, preserve the saved task and record the notification failure so it can be retried safely.

Step 4: Test the workflow

Test Case 1: Submit a valid task.

Expected result: A new spreadsheet row appears and a confirmation email is sent.

Test Case 2: Leave the task title empty.

Expected result: The submission is rejected or routed for correction.

Test Case 3: Leave the due date empty.

Expected result: The task can still be saved because the due date is optional.

Test Case 4: Make the spreadsheet connection unavailable.

Expected result: The workflow records or exposes the failure and does not send a false success confirmation.

Test Case 5: Make the email step fail after the task is saved.

Expected result: The task remains recorded, and the notification failure can be investigated or retried without creating another task.

Step 5: Explain the automation

Ask participants:

MissAlpha™ AI Labs

1. What triggers the workflow?
2. What does the Edit Fields node do?
3. Why is validation necessary?
4. Where is the task stored?
5. Why should email confirmation happen after successful saving?
6. What happens if one node fails?
7. Which steps could be improved with AI later?

Expected output

A functioning workflow that accepts a form submission, validates the input, saves the task to a spreadsheet, and sends a confirmation email.

Success criteria: Correct field mapping, successful data storage, appropriate confirmation, and tested failure handling.

Security note: Use synthetic data, authorized accounts, and test recipients. Never place passwords, OTPs, or other secrets in the form.

ACTIVITY 5 — UNSOLVED CHALLENGE

AI-Powered Customer Support & Lead Management Automation

Tool: Participants' choice of ChatGPT, Claude, n8n, or a combination
Level: Intermediate to Advanced
Type: Independent challenge — no solution provided

Real-world business scenario

A growing service company receives enquiries through its website, email, and contact forms.

The team faces these problems:

- Enquiries arrive from multiple sources.
- Some customers wait too long for a response.
- Sales leads are not consistently categorized.
- Support requests are mixed with sales enquiries.
- Follow-ups are forgotten.
- Duplicate enquiries create confusion.

MissAlphaTM AI Labs

- Managers cannot easily see the current status of each enquiry.

The company wants an AI-powered automation system that organizes incoming enquiries, supports customer service, and helps the team manage leads.

Your task is to design a practical solution.

CHALLENGE OBJECTIVE

Create an automation that captures enquiries, validates the data, classifies the request, assigns a priority, stores the record, and recommends or triggers the appropriate next step.

You must decide how to handle unclear requests, duplicate records, urgent complaints, and failed integrations.

REQUIREMENTS

Your proposed system must address the following:

1. Enquiry collection

Design a way to capture enquiries from at least one source, such as a website form or email.

Define the fields required to create a record.

2. AI classification

Design a method to classify each enquiry into categories such as:

- Sales Enquiry
- Product Information
- Technical Support
- Billing Question
- Complaint
- Other

Explain when AI should classify the request and when a human should review it.

3. Lead qualification

Define the information required to qualify a sales lead.

Develop transparent rules for distinguishing high-priority opportunities from routine enquiries.

MissAlphaTM AI Labs

Do not invent a customer's budget, purchase intent, or urgency.

4. Customer support routing

Determine how support requests should be assigned, prioritized, and tracked.

Explain how urgent or sensitive complaints should be escalated.

5. Data storage

Design a record structure that includes:

- Enquiry ID
- Date Received
- Customer Name
- Contact Details
- Enquiry Source
- Enquiry Category
- Priority
- Assigned Owner
- Current Status
- Next Action
- Follow-up Date
- Last Updated

Define suitable statuses and rules for updating them.

6. Response drafting

Design an AI-assisted process to draft appropriate replies using approved information.

Explain how the system should handle missing information, uncertain answers, refunds, complaints, and requests that require a human decision.

7. Follow-up automation

Design a process for identifying enquiries that require follow-up.

Include duplicate prevention, configurable follow-up intervals, and rules for stopping reminders when an enquiry is closed or the customer has opted out.

8. Reporting

Design a dashboard or report showing useful operational measures, such as:

MissAlpha™ AI Labs

- Number of enquiries received.
- Enquiries by category.
- Unassigned enquiries.
- Open support cases.
- Follow-ups due.
- Overdue enquiries.
- Response time, if reliable timestamps are available.
- Status of qualified leads.

Define how each metric will be calculated.

9. Error handling and security

Your design must address:

- Missing customer information.
- Duplicate submissions.
- AI classification failures.
- Failed data storage.
- Failed notifications.
- Unauthorized access.
- Sensitive customer data.
- Incorrect or unapproved customer responses.

Do not send automated external replies until the necessary approval rules have been defined.

REQUIRED DELIVERABLES

Submit the following:

A. Problem analysis
B. Proposed system architecture
C. Workflow diagram
D. Data schema
E. Classification and prioritization rules
F. AI prompt for enquiry classification
G. Node-by-node automation plan
H. Sample synthetic test data

MissAlpha™ AI Labs

I. At least eight test cases
J. Security and human-approval plan
K. Demonstration of the proposed solution
L. Explanation of limitations and future improvements

ACCEPTANCE CRITERIA

Your solution will be evaluated on:

- Problem understanding.
- Correct workflow sequence.
- Appropriate use of AI.
- Data validation and reliability.
- Clear classification rules.
- Duplicate prevention.
- Human oversight.
- Security and privacy.
- Error recovery.
- Quality of the final demonstration.

Constraint: Do not assume that an AI model, CRM, email account, or external service is already connected. Clearly identify the required setup and permissions.

Your challenge: Build the smallest reliable version first. Demonstrate it with synthetic data, test failures, and explain what happens at each step.

FINAL CHECKLIST

By the end of these five activities, you should be able to:

1. Configure a Custom GPT with clear instructions and boundaries.
2. Use Claude to design a productivity workflow around authorized Workspace data.
3. Convert a natural-language automation requirement into an n8n workflow design.
4. Build a basic n8n form-to-spreadsheet-to-email workflow manually.
5. Design an independent customer support and lead management automation.
6. Distinguish AI reasoning from deterministic business rules.
7. Validate outputs and test failure scenarios.
8. Apply privacy, permissions, human approval, and error handling.

MissAlpha™ AI Labs

Golden rule: AI helps interpret information and recommend actions. Automation executes configured steps. Reliable systems validate inputs, respect permissions, handle failures, and verify results.
